

MOOD EXAMPLE WITH PROMPT AND RESPONSE

PROBLEM STATEMENT:

A computer program is required by Professor Herman to allow students to input from a keyboard an integer between 1 and 6 indicating their mood. A value of 1 indicates a terrible mood and a value of 6 indicates a terrific mood. The prompt and response method will be used to terminate the input process. Each student will also input their ID number. For each student, their ID as well as a mood category will be output to the screen. The categories are 'green' for moods 4, 5, and 6; and red for moods 1, 2, and 3. At the conclusion of the input cycle, the program must output a report to the screen containing the average, highest, and lowest values of mood as well as the student IDs corresponding to the high and low values .

INPUT/OUTPUT DESIGN:

OUTPUT:

id: Student ID

moodCat: mood category

avg: average mood score for class

high: highest mood score for class

highID: ID of the student with the highest mood score

low: lowest mood score for class

lowID: ID of the student with the lowest mood score

INPUT:

more: response to prompt for additional inputs

id: Student ID

mood: mood score reported by the student
